

Anti-Virus Software Versus Depositit Offsite Storage

The recent MyDoom Virus is reported to be the fastest hitting and most costly virus released to date, reaching more than 160 countries and peaking at one in ten of all emails sent, according to analyst Gartner.

Security firm mi2g estimates the cost of the virus to be in the region of \$38billion, based on factors such as loss of business, bandwidth clogging, loss of productivity, cost of recovery and software upgrades!

If fortunately you yourself weren't affected, you probably know at least one person or company that was, and they say this is just the first of many that will be unleashed over the coming year - each one becoming more ferocious and intelligent than the next!

Has there ever been a better time or reason to ensure your computer data is securely backed up?

Many computer users have anti-virus software loaded onto their machines, and each new virus further increases sales for companies such as McAfee and Symantec! Even when 'protected' these customers will pray that it works and all updates are up to date when the virus hits. But what if it doesn't? What if the user or someone else accidentally 'accepts' and 'opens' that infected email? What backup is in place to protect against this? How would you feel if you watched your data become corrupted, within a matter of seconds?

Run a quick equation in your mind and consider the value of the data on your machine, then consider the cost of Depositit's solution?

Mortgage Promotions is offering members the Depositit service from just £49 + vat pa. That works out at less than a fraction of the price of a cup of coffee each day. Once installed and set up, all selected files are backed up automatically so customers do not have to do anything, except be rest assured that their data is completely safe and instantly retrievable in the event of an emergency.
